LIVING THINGS

The seven life processes

All living things carry out these seven processes.

Movement

Living things change position or move parts of themselves.

Respiration

Cells release energy from food.

Sensitivity

Detecting and responding to changes in the surroundings.

Growth

An increase in size and in the number of cells.

Reproduction

Producing offspring.

Excretion

Removing waste made by the body's chemical reactions.

Nutrition

Taking in the nutrients needed for energy and growth.
